

# University of Djilali Bounaama - Khemis Miliana

## Faculty of Economic, Commercial, and Management Sciences

Level: First Year (Branch 2)

Subject: Statistics 2

### Exercise Series No. 2: (Combinatorics)

---

**Exercise 1:** In how many ways can 5 people be seated around a circular table?

**Exercise 2:** How many different words (arrangements) can be formed using the letters of the following words:

- \* griller
- \* mississippi
- \* economie

**Exercise 3:** 7 people are hiking in the mountains: 3 of them are locals (mountain guides) and 4 are tourists. In how many different ways can the 7 people be arranged in a line, given that the first and the last person in the line must be locals?

**Exercise 4:** How many different license plates can be created using two letters followed by three digits in the following cases:

- \* a- Without repetition of letters or digits.
- \* b- Repetition of letters is allowed, but without repetition of digits.
- \* c- Repetition of both letters and digits is allowed.

**Exercise 5:** The Department of Commercial Sciences wants to form a pedagogical committee through an election process. For this purpose, 2 students from the 1st year, 3 students from the 2nd year, and 4 students from the 3rd year have applied. How many different committees can be formed from these candidates, given that the committee consists of:

- \* President: Must be a 3rd-year student.
- \* First Vice-President: Must be a 2nd-year student.
- \* Second Vice-President: Must be a 1st-year student.

**Exercise 6:** In how many ways can a committee of 5 people be formed from a group of 7 workers and 8 professors, provided that the committee must contain at least 3 workers?

**Exercise 7:** 4 light bulbs are drawn randomly from a box containing 10 bulbs, 6 of which are defective.

- \* What is the total number of possible ways to draw the bulbs?
- \* In how many ways can the bulbs be drawn such that exactly one bulb is non-defective (functional)?
- \* In how many ways can the bulbs be drawn such that at least one bulb is non-defective (functional)?

## Abstract of the Third Axis : Combinatorial Analysis

There are 3 types of method in combinatorial analysis :

	<b>without repetition</b>	<b>with repetition</b>
1- Permutations	<p>The following question is the essence of permutations :</p> <p>How many different arrangements of « n » elements are possible ?</p> <p>Different permutations. Generally, for « n » objects, there are :</p> $P(n) = n! = n(n-1)(n-2) \dots 1$ <p><u>special case : Circular Permutation</u></p> $P(n') = (n-1)!$ <p>In this situation, there is :</p> <ul style="list-style-type: none"> <li>- No repetition</li> <li>- Important arrangement</li> </ul>	<p>The following question is the essence of permutations :</p> <p>How many different arrangements of « n » elements are possible with repetition of « r » elements ?</p> <p>Different permutations. Generally, for « n » objects and repetition of « r » objects , there are : <math>P'(n) = n! / r!</math></p> <p>In this situation, there is :</p> <ul style="list-style-type: none"> <li>- Repetition</li> <li>- Important arrangement</li> </ul>
1- Arrangements :	<p>The following question is the essence of Arrangements without repetition :</p> <p>How many <u>different ways</u> are there to choose « r » elements out of « n » total elements without repetition ?</p> <p>Mathematically, one writes :</p> $A_n^r = n! / (n-r)!$ <p>In this situation, there is :</p> <ul style="list-style-type: none"> <li>- No repetition</li> <li>- Important arrangement</li> </ul>	<p>The following question is the essence of Arrangements without repetition :</p> <p>How many <u>different ways</u> are there to choose « r » elements out of « n » total elements with repetition ?</p> <p>Mathematically, one writes :</p> $AR_n^r = n^r$ <p>In this situation, there is :</p> <ul style="list-style-type: none"> <li>- Repetition</li> <li>Important arrangement</li> </ul>
2- Combinations	<p>The following question is the essence of combinations without repetition :</p> <p>How many <u>ways</u> are there to choose « r » elements out of « n » total elements without repetition ?</p> <p>Mathematically, one writes :</p> $C_n^r = n! / r! (n-r)!$ <p>In this situation, there is :</p> <ul style="list-style-type: none"> <li>- No repetition</li> <li>- Unimportant arrangement</li> </ul>	<p>The following question is the essence of combinations with repetition :</p> <p>How many <u>ways</u> are there to choose « r » elements out of « n » total elements with repetition ?</p> <p>Mathematically, one writes :</p> $C_{n+r-1}^r = (n+r-1)! / r! (n-1)!$ <p>In this situation, there is :</p> <ul style="list-style-type: none"> <li>- Repetition</li> <li>Unimportant arrangement</li> </ul>

Important in combinatorial analysis :

- $0! = 1.$
- $C_n^r = C_n^{n-r}$
- $C_n^n = 1$
- $C_n^0 = 1$
- $C_n^1 = n$
