

Chapter 3:

Basic Operations

Chapter 3: Basic Operations in Fortran

3.1 Arithmetic Operations

Operation	Symbol	Example
Addition	+	$z = x + y$
Subtraction	-	$z = x - y$
Multiplication	*	$z = x * y$
Division	/	$z = x / y$
Exponentiation	**	$z = x ** y$

3.2 Mathematical Functions

Function	Description	Example
ABS(x)	Absolute value	$ABS(-5) \rightarrow 5$
SQRT(x)	Square root	$SQRT(9.0) \rightarrow 3.0$
EXP(x)	Exponential function (e^x)	$EXP(1.0) \rightarrow 2.718$
LOG(x)	Natural logarithm (ln)	$LOG(2.718) \rightarrow 1.0$
LOG10(x)	Logarithm base 10	$LOG10(100.0) \rightarrow 2.0$
SIN(x)	Sine (radians)	$SIN(PI/2) \rightarrow 1.0$
COS(x)	Cosine (radians)	$COS(PI) \rightarrow -1.0$
TAN(x)	Tangent (radians)	$TAN(PI/4) \rightarrow 1.0$

3.3 Operator Precedence

Fortran follows standard precedence rules:

1. **Parentheses ()**
2. **Exponentiation ****
3. **Multiplication * and Division /**
4. **Addition + and Subtraction -**

Example:

$x = 5 + 3 * 2$! $x = 11$ (Multiplication first)
 $y = (5 + 3) * 2$! $y = 16$ (Parentheses first)

Conclusion

- **Syntax rules** ensure that Fortran programs are structured correctly.
- **Variable precision can be increased using DOUBLE PRECISION and KIND.**
- **READ and WRITE** are used for user input and output.
- **Basic operations include arithmetic, relational, and mathematical functions.**
